### ***Double Patenting***

A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain a patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

Claim 25 is rejected under 35 U.S.C. 101 as claiming the same invention as that of claim 13 of prior U.S. Patent No. 6,610,150. This is a double patenting rejection.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 14, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Akimoto et al. in regards to claim 14 Akimoto et al. US 5,364,222 teaches a device for processing semiconductor wafers comprising:

a dual-wafer single axis transfer arm (30), adapted to carry wafers from a cassette (2) to a process chamber (20), said transfer arm (30) having a monolithic arm (35) pivotally mounted at said axis;

wherein said transfer arm (30) is adapted to carry at least 2 wafers between the cassette and the process chamber.

Akimoto et al. do not teach the transfer section (7) as being a load lock, however it would have been obvious to one of ordinary skill in the art, at the time of invention to have the transfer device located in a load lock as load locks are commonly used in the art as a means to prevent contaminants from entering the process chambers, as well as allowing the process chamber to remain at a pressure differing from the ambient environment, thereby increasing the output of the device by decreasing cycle times for processing a wafer.

In regards to claims 17 and 18 Akimoto et al. further teach a lower shelf (37) can carry a processed wafer and an upper shelf that can carry an unprocessed wafer. See column 4 lines 45-62.

#### ***Response to Amendment***

The pre amendment filed with this application has been entered into the record.

#### ***Allowable Subject Matter***

Claims 15 and 16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. The closest prior art of Akimoto et al. does not teach or suggest that the transfer arms pivot to extend into the process chamber and to retract into the load lock chamber.
